

Octa-Blocs™ enables compatible components to fit together securely and easily

Rempel Bros. Concrete Ltd. and Ocean Construction Supplies Ltd., two ready-mixed concrete companies in the greater Vancouver, BC, are producing and selling their own unique Octa-Blocs™. These are blocks from ready-mixed concrete that comes back to their plants from over-ordered jobs or as leftovers in pump hoppers.

The two companies have developed a distinctive system for concrete blocks. They have designed and built many different complementary shapes of the new trademarked Octa-Blocs™. Their blocks have standardized octagon-shaped protrusions and indentations on alternating sides. This enables the

compatible components of the system to fit together as securely and easily as a child's snap-together building blocks.

A standard size Octa-Bloc™ is a large, rectangular building piece about 5 feet (1.5 meters) long and 30 inches (76 centimeters) deep and tall. A half standard block is almost a perfect, 30-inch cube. The product line includes L and T shapes for junctures in construction and blocks with angled tops to create a finished, tapered edge for retaining walls. Of course, each has the special octagon-shaped design that permits interlocking. Octa-Blocs™ are currently filling many uses for stabilizing including hilly surfaces, tennis courts, retaining walls and foundation walls.

If you are interested in using Octa-Blocs™ for your project, please contact:
